Project Description

An app that will merge contacts from various sources. The user will include or disclude sources such as sdcard, sim card, internal storage, etc, and choose which contacts to merge; or have likely merge candidates automatically selected. They will then be guided through any user input needed, such as choosing between conflicting information in a certain field; eg different addresses. The program will take automatic merge measures, such as names that are the same albeit with different capitalization. The user will be able to look at and manually change and fields. A common use would be merging duplicate contacts between a sim card and sd card (eg when switching to new phone) and produce a clean new list without duplicates.

Potential Names for App

- cMerge, Contact Merger

Project Management

- Version control software (git) and a hosting service (eg github) will be used to maintain the project.
- So as to allow the group members to use the project code and resources independently of each other and for whatever purpose upon projects completion; the project will be licensed under a permissive free software license such as BSD or MIT.
- Each source file will contain a notice at top specifying initial author. The project will contain a file detailing work done by each group member, based on latest commit history (lines changed / added) at project submission.

- The project will be planned before starting, with each member having responsibility for an reasonably equal portion of the project.
- Each member will have a planned timeline, of when certain parts of the project should be completed by, with time for testing and review of each and the final whole project.

Team Member Constraints

DaveGwee

- Currently doing 3 units including the final year project, working as part time, have no issues on family, no working during day with classes which are tuesday, wednesday and friday, will contribute a fairly enough amount of time and effort on this project.

Finn Ryan

- Undertaking 3 units with no other serious sinks for my time.

Kaito Kamiyama

- Currently taking 4 units and working as casual with being called in some what frequently. The classes are distributed within the weekdays.

Conflict Resolution

- Since there are 3 group members, a vote on any contested issues will be used to decide.

NOTE:

I am using a program, pandoc, to convert github markdown (these .md files) to pdf format.

Invoking with eg 'pandoc -V fontenc=LY1 -f markdown_github -t latex -o charter.pdf CHARTER.md'
